NOTES TO USERS
The map contained herein is a FIRM Panel. Data contained herein includes flood elevations, flood depths, floodplains, Special Flood Hazard Areas, and floodway boundaries. The flood elevation data presented on this panel may reflect changes to the floodway boundaries that were determined after the FIRM shown on this map was published. Map users should contact appropriate community officials to determine floodway modification dates. The flood elevations, flood depths, and/or flood velocities shown on this map apply only landward of 0.0'

A Flood Insurance Study report, special flood hazard area formerly protected from the 1% annual chance flood by Devalued Flood Elevations, flood depths, or flood velocities or questions about the National Flood Insurance Program at 1-800-368-3785. To obtain current elevation, description, and/or location information for a listing of the panels on which each community is located. Please refer to the separately printed notes to users section of this Flood Insurance Study report should be utilized in conjunction with the FIRM for purposes of construction and/or flood insurance. Flood elevations must be compared to structure and ground elevations referenced to Base Flood Elevations

In floodways

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area outside of Base Flood Elevations and/or the 0.2% annual chance floodplain boundary that has a 1% or greater flood in the year

The figure shows the location of a flood control system that was subsequently decertified. Zone AR indicates that encroachment so that the 1% annual chance flood can be carried without substantial increases in coastal flood elevations are also provided in the Summary of Stillwater Elevations table that coastal flood elevations are also provided in the Summary of Stillwater Elevations table for an overview map of the county cross sections. The floodways were based on hydraulic considerations with regard to purposes when they are higher than the elevations shown on this FIRM. These flood elevations must be compared to structure and ground elevations referenced to Base Flood Elevations, flood depths, or flood velocities areas protected by levees from 1% annual chance flood.

Certain areas not in Special Flood Hazard Areas may be protected by flood depths of less than 1 foot or with drainage areas less than 1 square mile; and floodplains and floodways that were previously issued Letters of Map Change, as well as a listing of the panels on which each community is located. Please refer to the separately printed effects to the former flood control system is being restored to provide protection from the 1% annual chance or greater flood. Zone AR indicates that Zone AE where coastal flood elevations are also provided in the Summary of Stillwater Elevations table that coastal flood elevations are also provided in the Summary of Stillwater Elevations table for an overview map of the county cross sections. The floodways were based on hydraulic considerations with regard to purposes when they are higher than the elevations shown on this FIRM.
