The map shown on the previous page of the Federal Emergency Management Agency (FEMA) Flood Insurance Program (FIP) binder contains mapped information that indicates areas subject to flooded conditions by the 1% annual chance flood. This sheet contains a portion of the Flood Insurance Study (FIS) report. The FIS is prepared by the Flood Insurance Study Project (FISP) and is based on data collected by State, local, federal, and other sources.

The Flood Insurance Study Report (FIS) may be obtained by contacting the Community Relations Office at your local Federal Emergency Management Agency (FEMA) Regional Office. The FIS is the primary source of flood elevation information published by FEMA. It contains authoritative hydraulic data that includes flood profiles, floodway data, and other information.

Special Flood Hazard Areas (SFHA) are areas subject to the 1% annual chance flood. The Base Flood Elevation (BFE) denotes the water-surface elevation of the 1% annual chance flood. Special Flood Hazard Areas include Zones A, AE, AH, AO, AR, A99, V, and VE. The BFEs are rounded whole-foot elevations, and zones are determined based on FEMA's 1964 Flood Frequency Study (FFS).

Maps published before the 1974 Federal Emergency Management Act (FEMA) may not conform to current Federal and/or International Standards and Practices. In such cases, the map may not accurately reflect the floodplain boundaries. Map data is subject to change due to annexations or de-annexations, and the Federal Emergency Management Agency (FEMA) is not responsible for updating or maintaining such changes.

The map shown on this page contains the COORDINATE BOUNDS for the LeFlore County and Incorporated Areas FIRM. The COORDINATE BOUNDS are used to locate and identify the map panel on which this area is shown. The COORDINATE BOUNDS are based on the National Grid System and are shown in both Easting and Northing values.

The map shown on this page is a FIRM (Flood Insurance Rate Map) panel that contains flood elevation information. The FIRM panel is a 1000-foot grid and is referenced to the North American Vertical Datum of 1988.

The floodplain boundaries are shown on the FIRM panel and are based on hydraulic data contained in the Flood Insurance Study (FIS) report. The FIRM panel contains floodway data, floodplain data, and other information.

The BFEs shown on this FIRM panel are rounded whole-foot elevations. These BFEs are determined based on hydraulic data contained in the FIS report. The BFEs are shown on the FIRM panel and are used to determine the flood insurance rates for properties located within Special Flood Hazard Areas.

If you have questions about the map or the contents, please contact your local Federal Emergency Management Agency (FEMA) office or your local insurance agent.
