Base Flood Elevation value where uniform within zone; elevation were computed at cross sections and interpolated between 1200.

The Flood Insurance Study report should be utilized in conjunction with the FIRM for purposes of construction and/or purposes when they are higher than the elevations shown on this FIRM.

Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.

This map reflects more detailed and up-to-date stream channel configurations. As a result, the Flood Profiles and Floodway Data tables

Lands areas not in Special Flood Hazard Areas may be protected by flood control works that may not be indicated on the Flood Insurance Rate Map (FIRM). Water surface elevations for these works should be determined by contacting appropriate community officials.

These flood elevations must be compared to structure and ground elevations referenced to N. These evaluations do not necessarily identify all areas subject to flooding, particularly from local drainage sources of water. In areas adjacent to long term river basins, the 1% annual chance flooding is a result of all flood sources in the area. Where such flooding is a result of all flood sources in the area. Where such flooding is a result of all flood sources in the area. Where such flooding is a result of all flood sources in the area.
